**Abstract-** Velicko investigated the concepts of  $\theta$ -open and  $\delta$ -open sets. Stone studied the concepts of regular open sets and Levine introduced the concept of semi-open sets. In this paper several versions of semi-open sets have been introduced by mixing the concepts of  $\theta$ -Open sets,  $\delta$ -open sets and regular open sets and their basic properties have been discussed.

**Keywords:** semi-open sets,  $\theta$ -open sets,  $\delta$ -open sets, regular space, semi-regular space.

**2010 AMS Subject Classification:** 54A05, 54A10.

The notions of  $\theta$ -open sets and  $\delta$ -open sets were studied by Velicko[6]. Levine[3] discussed the concept of semi-open sets to analyze the functions weaker than continuous functions. In this paper, new types of semi-open sets have been introduced by using the concepts of  $\theta$ -open sets and  $\delta$ -open sets.

## I. PRELIMINARIES

Throughout this paper  $(X, \tau)$  is a topological space and  $S$  is a subset of  $X$ . The interior and closure of a subset  $S$  of  $X$  with respect to the topology  $\tau$  are denoted by  $\text{Int}S$  and  $\text{Cl}S$  respectively.  $S$  is regular open [5] if  $S = \text{Int Cl } S$  and is regular closed if  $S = \text{Cl Int } S$ . Let  $\text{RO}(X, \tau)$  denote the collection of all regular open sets in  $(X, \tau)$ . Since the union of regular open sets is not regular open,  $\text{RO}(X, \tau)$  is not topology on  $X$ . However, since the intersection of two regular open sets is regular open,  $\text{RO}(X, \tau)$  is a base for some topology on  $X$ . This topology is denoted by  $\tau\delta$  and the members of  $\tau\delta$  are called  $\delta$ -open sets in  $(X, \tau)$ . Clearly  $S$  is  $\delta$ -open iff for all  $x \in S$  there exists a closed set  $F$  with  $x \in \text{Int}F \subseteq S$ . That is every  $\delta$ -open set is a union of regular open sets. The topology  $\tau\delta$  is called the semi-regularization of  $\tau$ . Clearly  $\text{RO}(X, \tau) \subseteq \tau\delta \subseteq \tau$ . Velicko defined the  $\theta$ -closure operator in a topological space  $(X, \tau)$ . An element  $x$  in  $X$  is in  $\theta$ -closure of a subset  $A$  of  $X$ , denoted by  $x \in \theta \text{Cl}A$  if for every open set  $U$  containing  $x$ ,  $\text{Cl}U \cap A \neq \emptyset$ . The  $\theta$ -interior operator can be defined as  $\theta \text{Int}A = X \setminus \theta \text{Cl}(X \setminus A)$ . The subset  $A$  of  $X$  is  $\theta$ -closed if  $A = \theta \text{Cl}A$  and is  $\theta$ -open if  $A = \theta \text{Int}A$ . Clearly  $A$  is  $\theta$ -open if and only if  $X \setminus A$  is  $\theta$ -closed. In fact  $S$  is  $\theta$ -open if for all  $x \in S$  there exists an open set  $U$  with  $x \in U \subseteq \text{Cl}U \subseteq S$ . The collection of all  $\theta$ -open sets in  $(X, \tau)$  is a topology on  $X$ , denoted  $\tau\theta$ . It is noteworthy to see that  $\tau\theta \subseteq \tau\delta \subseteq \tau$ . Mila Mrsevic and Andrijevic [2] concluded that the operator  $\theta \text{Cl}$  is not idempotent that is  $\theta \text{Cl}(\theta \text{Cl}A) \neq \theta \text{Cl}A$ . A subset  $S$  of  $X$  is semi-open [3] if  $S \subseteq \text{Cl Int } S$  and is semi-closed if  $S \supseteq \text{Cl Int } S$ . In the next two sections, the new versions of semi-open sets have been introduced by using the operators namely  $\text{Int}\delta A$ ,  $\text{Cl}\delta A$ ,  $\text{Int}\theta A$  and  $\text{Cl}\theta A$  which respectively denote the  $\delta$ -interior,  $\delta$ -closure, the  $\theta$ -interior and  $\theta$ -closure of  $A$  in  $(X, \tau)$ . The following definitions and results will be useful in sequel.

Definition 1.1: A space  $(X, \tau)$  is

(i).regular if for every  $x$  in  $X$  and for every open set  $V$  containing  $x$  there exists an open set  $U$  such that  $x \in U \subseteq \text{Cl}U \subseteq V$ .

(ii).almost regular [4] if for every  $x$  in  $X$  and for every open set  $V$  containing  $x$  there exists an open set  $U$  such that  $x \in U \subseteq \text{Cl}U \subseteq \text{Int}V$ .

The next lemma has been established in [4].

Lemma 1.2: A topological space  $(X, \tau)$  is (i) regular if and only if  $\tau\theta = \tau$ ; (ii) semi-regular if and only if  $\tau\delta = \tau$  and (iii) almost regular if and only if  $\tau\theta = \tau\delta$ .

The following definition is due to the authors [1].

Definition 1.3: A subset  $A$  of a space  $(X, \tau)$  is

(i). regular  $\theta$ -open (resp. regular  $\theta$ -closed) in  $(X, \tau)$  if  $A = \text{Int}\theta \text{Cl}\theta A$  (resp.  $A = \text{Cl}\theta \text{Int}\theta A$ ).

(ii). regular  $\delta$ -open (resp. regular  $\delta$ -closed) in  $(X, \tau)$  if  $A = \text{Int}\delta \text{Cl}\delta A$  (resp.  $A = \text{Cl}\delta \text{Int}\delta A$ ).

(i). regular  $\theta^*$ -open ( resp. regular  $\theta^*$ -closed) in  $(X, \tau)$  if  $A = \text{Int}\theta \text{Cl}A$  (resp.  $A = \text{Cl}\theta \text{Int}A$ ).

(ii). regular  $\delta^*$ -open (resp. regular  $\delta^*$ -closed) in  $(X, \tau)$  if  $A = \text{Int} \delta \text{ Cl} A$  (resp.  $A = \text{Cl} \delta \text{ Int} A$ ).

## II. SEMI $\theta$ -OPEN SETS AND SEMI $\theta^*$ -OPEN SETS

In this section, the notions of semi  $\theta$ -open, semi  $\theta$ -closed, semi  $\theta^*$ -open and semi  $\theta$ -closed sets are introduced and studied. Before this,  $\theta$ -open and  $\theta$ -closed are characterized in the following proposition by using semi-open sets.

Proposition 2.1: A subset  $A$  of a space  $(X, \tau)$  is

(i).  $\theta$ -open iff for all  $x \in A$  there exists a semi-open set  $U$  with  $x \in \text{Int} U \subseteq \text{Cl} U \subseteq A$ .

(ii).  $\theta$ -closed iff for all  $x \notin A$  there exists a semi-closed set  $F$  with  $A \subseteq \text{Int} F \subseteq \text{Cl} F$  and  $x \notin \text{Cl} F$ .

Proof: The necessary part of (i) follows easily from the definition of a  $\theta$ -open as every open set is semi-open. Let  $A$  be subset of  $X$ . Suppose for all  $x \in A$  there exists a semi-open set  $U$  with  $x \in \text{Int} U \subseteq \text{Cl} U \subseteq A$ . Since  $\text{Int} U$  is an open set and since  $x \in \text{Int} U \subseteq \text{Cl} \text{Int} U \subseteq \text{Cl} U \subseteq A$  it follows that  $A$  is  $\theta$ -open. This proves (i). Now suppose  $A$  is  $\theta$ -closed. Then  $X \setminus A$  is  $\theta$ -open. Then for all  $x \in X \setminus A$  there exists a semi-open set  $U$  with  $x \in \text{Int} U \subseteq \text{Cl} U \subseteq X \setminus A$  that is  $A \subseteq X \setminus \text{Cl} U \subseteq X \setminus \text{Int} U = \text{Cl}(X \setminus U)$  that implies  $A \subseteq \text{Int} F \subseteq \text{Cl} F$  and  $x \notin \text{Cl} F$  where  $F = X \setminus U$  which is semi-closed. Conversely let for all  $x \notin A$  there exists a semi-closed set  $F$  with  $A \subseteq \text{Int} F \subseteq \text{Cl} F$  and  $x \notin \text{Cl} F$ . If  $x \in X \setminus A$  then there exists a semi-closed set  $F$  with  $A \subseteq \text{Int} F \subseteq \text{Cl} F$  and  $x \notin \text{Cl} F$  that implies  $x \in X \setminus \text{Cl} F \subseteq X \setminus \text{Int} F \subseteq X \setminus A$  that is  $x \in \text{Int}(X \setminus F) \subseteq X \setminus \text{Cl}(X \setminus F) \subseteq X \setminus A$  which further implies by (i) that  $X \setminus A$  is  $\theta$ -open. Therefore  $A$  is  $\theta$ -closed. This proves (ii).

Definition 2.2: A subset  $A$  of  $X$

(i). is semi  $\theta$ -open (resp. semi  $\theta^*$ -open) in  $(X, \tau)$  if  $A \subseteq \text{Cl} \theta \text{ Int} \theta A$  (resp.  $A \subseteq \text{Cl} \theta \text{ Int} A$ ).

(ii). is semi  $\theta$ -closed (resp. semi  $\theta^*$ -closed) in  $(X, \tau)$  if  $A \supseteq \text{Int} \theta \text{ Cl} \theta A$  (resp.  $A \supseteq \text{Int} \theta \text{ Cl} A$ ).

Proposition 2.3:  $A$  is semi  $\theta$ -open in  $(X, \tau)$  if and only if  $A$  is semi-open in  $(X, \tau \theta)$

Proof: Follows from the fact that  $(X, \tau \theta)$  is a topological space.

Remark 2.4: Since  $\tau \theta$  is a topology on  $X$ , all the properties of semi-open sets in  $(X, \tau)$  also hold for semi  $\theta$ -open sets in  $(X, \tau)$  as seen in the next three propositions.

Proposition 2.5:

(i). If  $A$  is regular  $\theta$ -open (resp.  $\theta$ -open) then it is semi  $\theta$ -closed (resp. semi  $\theta$ -open).

(ii). If  $A$  is regular  $\theta$ -closed (resp.  $\theta$ -closed) then it is semi  $\theta$ -open (resp. semi  $\theta$ -closed).

Proposition 2.6:

(i). If  $A$  is semi-open or semi  $\theta$ -open or regular  $\theta^*$ -closed in  $(X, \tau)$  then it is semi  $\theta^*$ -open.

(ii). If  $A$  is semi-closed or semi  $\theta$ -closed or regular  $\theta^*$ -open in  $(X, \tau)$  then it is semi  $\theta^*$ -closed.

Proposition 2.7:

(i). If  $A$  is semi  $\theta^*$ -open then it is contained in a regular  $\theta^*$ -closed set.

(ii). If  $A$  is semi  $\theta^*$ -closed then it is contained in a regular  $\theta^*$ -set.

## III. SEMI $\delta$ -OPEN SETS AND SEMI $\delta^*$ -OPEN SETS

In this section, semi  $\delta$ -open sets and semi  $\delta^*$ -open sets are introduced and studied. Before this,  $\delta$ -open and  $\delta$ -closed sets are characterized in the next proposition by using semi-open sets.

Proposition 3.1: A subset  $A$  of a space  $(X, \tau)$  is

(i).  $\delta$ -open iff for all  $x \in A$  there exists a semi-closed set  $F$  with  $x \in \text{Int} F \subseteq A$

(ii).  $\delta$ -closed iff for all  $x \notin A$  there exists an open set  $U$  with  $A \subseteq \text{Cl} U$  and  $x \notin \text{Cl} U$ .

Proof: The necessary parts of (i) follows easily from the definition of a  $\delta$ -open as every closed set is semi-closed. Suppose for all  $x \in A$  there exists a semi-closed set  $F$  with  $x \in \text{Int} F \subseteq A$ . If  $x \in A$  then there exists a semi-closed set  $F$  with  $x \in \text{Int} F \subseteq A$  that implies  $x \in \text{Int} F = \text{Int} s \text{Cl} F \subseteq \text{Int} \text{Cl} F \subseteq A$  that further implies that  $x \in \text{Int} B \subseteq A$  where  $B = \text{Cl} F$  is closed. Therefore  $A$  is  $\delta$ -open. This proves (i). Now suppose  $A$  is  $\delta$ -closed. Then  $X \setminus A$  is  $\delta$ -open. Then for  $x \in X \setminus A$  there exists a closed set  $F$  with  $x \in \text{Int} F \subseteq X \setminus A$  that is  $A \subseteq X \setminus \text{Int} F = \text{Cl}(X \setminus F)$  that implies  $A \subseteq \text{Cl} U$  and  $x \notin \text{Cl} U$  where  $U = X \setminus F$  which is open. Conversely let for all  $x \notin A$  there exists an open set  $U$  with  $A \subseteq \text{Cl} U$  and  $x \notin \text{Cl} U$ . If

$x \in X \setminus A$  then there exists an open set  $U$  with  $A \subseteq \text{Cl}U$  and  $x \notin \text{Cl}U$  that implies  $x \in X \setminus (\text{Cl}U \subseteq X \setminus A)$  that is  $x \in \text{Int}(X \setminus U) \subseteq X \setminus A$  which further implies by (i) that  $X \setminus A$  is  $\delta$ -open. Therefore  $A$  is  $\delta$ -closed. This proves (ii).

Definition 3.2: A subset  $A$  of a space  $(X, \tau)$  is

- (i). semi  $\delta$ -open (resp semi  $\delta^*$ -open) in  $(X, \tau)$  if  $A \subseteq \text{Cl}\delta\text{Int}\delta A$  (resp.  $A \subseteq \text{Cl}\delta\text{Int}A$ ) and
- (ii). semi  $\delta$ -closed (resp semi  $\delta^*$ -closed) in  $(X, \tau)$  if  $A \supseteq \text{Int}\delta\text{Cl}\delta A$  (resp.  $A \supseteq \text{Int}\delta\text{Cl}A$ ).

Proposition 3.3:  $A$  is semi  $\delta$ -open (resp. semi  $\delta$ -closed) in  $(X, \tau)$  if and only if  $A$  is semi-open (resp. semi-closed) in  $(X, \tau\delta)$ .

Proof: Follows from the fact that  $(X, \tau\delta)$  is a topological space.

Remark 3.4: Since  $\tau\delta$  is a topology on  $X$ , all the properties of semi-open sets in  $(X, \tau)$  also hold for semi  $\delta$ -open sets in  $(X, \tau)$  as seen in the next three propositions

Proposition 3.5:

- (i). If  $A$  is regular  $\delta$ -open (resp.  $\delta$ -open) then it is semi  $\delta$ -closed (resp. semi  $\delta$ -open).
- (ii). If  $A$  is regular  $\delta$ -closed (resp.  $\delta$ -closed) then it is semi  $\delta$ -open (resp. semi  $\delta$ -closed).

Proposition 3.6:

- (i). If  $A$  is semi-open or semi  $\delta$ -open or regular  $\delta^*$ -closed in  $(X, \tau)$  then it is semi  $\delta^*$ -open.
- (ii). If  $A$  is semi-closed or semi  $\delta$ -closed or regular  $\delta^*$ -open in  $(X, \tau)$  then it is semi  $\delta^*$ -closed.

Proposition 3.7:

- (i). If  $A$  is semi  $\delta$ -open (resp. semi  $\delta^*$ -open) then it is contained in a regular  $\delta$ -closed (resp. regular  $\delta^*$ -closed) set.
- (ii). If  $A$  is semi  $\delta$ -closed (resp. semi  $\delta^*$ -closed) then it is contained in a regular  $\delta$ -open (resp. regular  $\delta^*$ -open) set.

#### 4. Some common properties

Proposition 4.1:

- (i).  $A$  is semi  $\theta$ -open (resp. semi  $\theta^*$ -open) iff  $X \setminus A$  is semi  $\theta$ -closed (resp. semi  $\theta^*$ -closed)
- (ii).  $A$  is semi  $\delta$ -open (resp. semi  $\delta^*$ -open) iff  $X \setminus A$  is semi  $\delta$ -closed (resp. semi  $\delta^*$ -closed)

Proposition 4.2:

- (i) The intersection of two semi  $\theta$ -open (resp. semi  $\delta$ -open, resp. semi  $\theta^*$ -open, resp. semi  $\delta^*$ -open) sets in  $(X, \tau)$  is not semi  $\theta$ -open (resp. semi  $\delta$ -open, resp. semi  $\theta^*$ -open, resp. semi  $\delta^*$ -open) in  $(X, \tau)$ .
- (ii) The union of two semi  $\theta$ -closed (resp. semi  $\delta$ -closed, resp. semi  $\theta^*$ -closed, resp. semi  $\delta^*$ -closed) sets in  $(X, \tau)$  is not semi  $\theta$ -closed (resp. semi  $\delta$ -closed, resp. semi  $\theta^*$ -closed, resp. semi  $\delta^*$ -closed) in  $(X, \tau)$ .
- (iii) The intersection of two semi  $\theta$ -closed (resp. semi  $\delta$ -closed, resp. semi  $\theta^*$ -closed, resp. semi  $\delta^*$ -closed) sets in  $(X, \tau)$  is semi  $\theta$ -closed (resp. semi  $\delta$ -closed, resp. semi  $\theta^*$ -closed, resp. semi  $\delta^*$ -closed) in  $(X, \tau)$ .
- (iv) The union of two semi  $\theta$ -open (resp. semi  $\delta$ -open, resp. semi  $\theta^*$ -open, resp. semi  $\delta^*$ -open) sets in  $(X, \tau)$  is semi  $\theta$ -open (resp. semi  $\delta$ -open, resp. semi  $\theta^*$ -open, resp. semi  $\delta^*$ -open) in  $(X, \tau)$ .

The next three theorems follow from Lemma 1.2.

Theorem 4.3: In an almost regular space

- (i).  $A$  is semi  $\theta$ -open iff it is semi  $\delta$ -open,
- (ii).  $A$  is semi  $\theta^*$ -open iff it is semi  $\delta^*$ -open,
- (iii).  $A$  is semi  $\theta$ -closed iff it is semi  $\delta$ -closed,
- (iv).  $A$  is semi  $\theta^*$ -closed iff it is semi  $\delta^*$ -closed,

Theorem 4.4: In a semi-regular space

- (i).  $A$  is semi-open iff it is semi  $\delta$ -open,
- (ii).  $A$  is semi-closed iff it is semi  $\delta$ -closed,

Theorem 4.5: In a regular space the following are equivalent.

- (i).  $A$  is semi-open

- (ii). A is semi  $\delta$ -open
- (iii). A is semi  $\delta^*$ -open
- (ii). A is semi  $\theta$ -open
- (iii). A is semi  $\theta^*$ -open

#### IV. CONCLUSION:

The existing concepts that are related to  $\theta$ -open and  $\delta$ -open sets have been characterized in regular, semi-regular and almost regular spaces by the new notions such as semi  $\theta$ -open , semi  $\theta^*$ -open, semi  $\delta$ -open and semi  $\delta^*$ -open sets .
